

CIRCUIT BREAKER IDENTIFIER

Model CBI-1

The Model CBI-1 makes it extremely easy and fast to find the circuit breaker or fuse that supplies a specific power receptacle or light switch automatically. Just plug the transmitter into the receptacle and make a few quick scans of the power panel (the first scan calibrates the instrument, the second detects the breaker.) An audible tone will be clearly heard when the right breaker is scanned. There is no need to shut off power in a time consuming trial and error effort to find the right breaker or fuse. This is a tremendous benefit in both automated office environments where disruption of power is not practical, as well as in residential applications.

- Quickly identifies 120Vac circuit breakers and fuses
- Self-calibrating — no thumbwheels to adjust
- No need to interrupt power
- Audible tone generated when matching breaker is located
- Works with wiring faults

SPECIFICATIONS

Model CBI-1

Operating Frequency:
50 to 60Hz

Operating Voltage:
90 to 120VAC

Operating Temperature:
32° to 122°F (0° to 50°C)

Calibration:
Automatic

Transmitter Power:
Powered by wall outlet

Receiver Power:
9V Alkaline
(battery not included)

Catalog No.	Model	Description	Price
2115.49	CBI-1	Circuit Breaker Identifier	\$49.00
